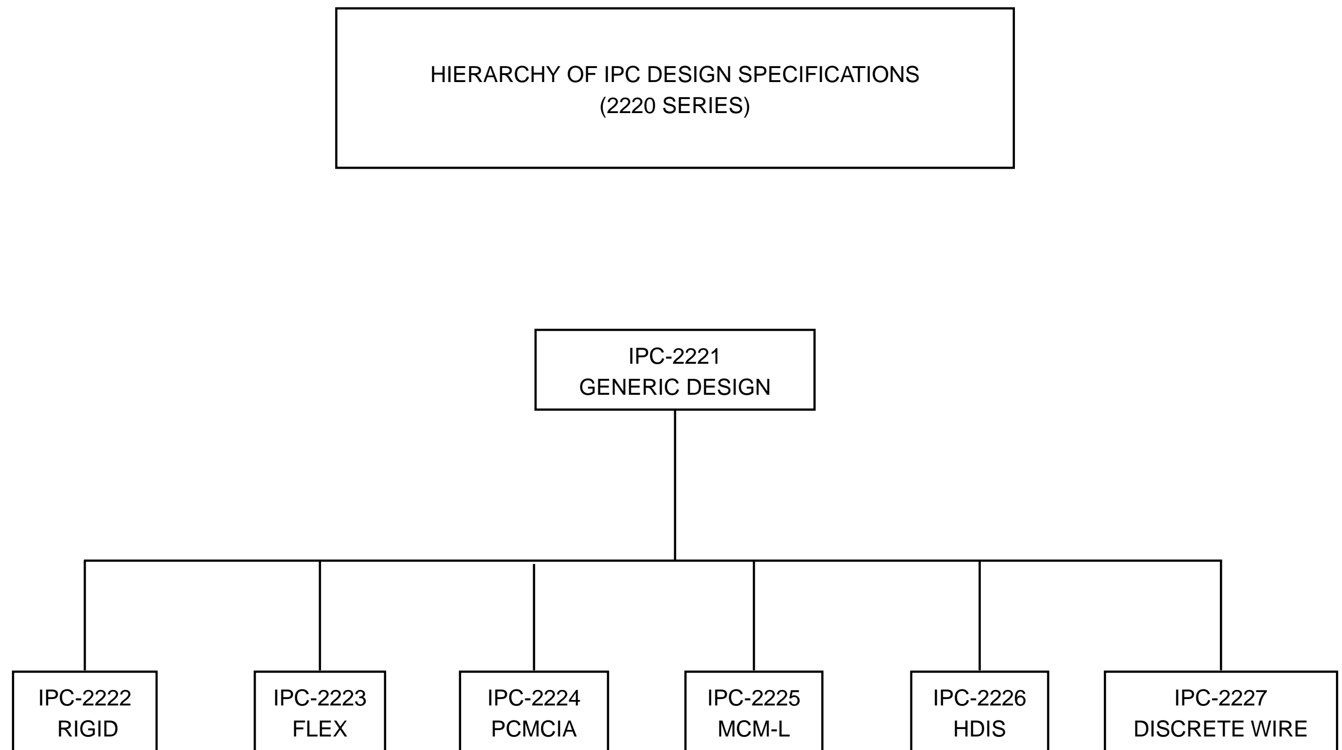
IPC-2225

Sectional Design Standard for Organic Multichip Modules (MCM-L) and MCM-L Assemblies

ANSI/IPC-2225
May 1998 A standard developed by IPC

2215 Sanders Road, Northbrook, IL 60062-6135
Tel. 847.509.9700 Fax 847.509.9798
www.ipc.org



FOREWORD

This standard is intended to provide information on the detailed requirements for organic Laminated Multichip Module (MCM-L) design. All aspects and details of the design requirements are addressed to the extent that they can be applied to the unique requirements of those designs that use organic rigid (reinforced), organic flexible (unreinforced) materials or organic materials in combination with inorganic materials (metal, glass, ceramic, etc.) to provide the structure for mounting and interconnecting unpackaged die.

The information contained herein is intended to supplement generic design requirements identified in IPC-2221. When coupled with the generic design input, it should facilitate the selection process of the materials and the detailed organic structure fabrication technology necessary to meet the engineering design objectives.

The selected component mounting and interconnecting technology for the physical Mounting and Interconnection Structure (MIS) should be commensurate with the requirements provided and the specific focus of this sectional document.

A description of what is an MCM-L and what permutations can be accomplished by mixing other MCM technologies is important to understand to ensure proper design. A detailed description is also provided on the identification of the product in terms of the materials and processes used to manufacture the MCM-L. Other forms of multichip modules are identified in order to establish the relationship with these technologies (i.e., MCM-C, MCM-D), and the design principles contained herein.

Differences between semiconductors, modules and boards relate to their application and are defined as:

ASIC Application Specific Integrated Circuit represents a semiconductor device intended to satisfy a unique complete circuit function.

ASEA Application Specific Electronic Assembly represents printed board assemblies consisting of electronic components attached to an interconnecting substrate, intended to perform a complete circuit or electronic function.

ASEM Application Specific Electronic Module represents a grouping of components intended as a subassembly or super-part that will be interconnected on an ASEA.

Because of the similarity between various techniques, an attempt to describe the variation between Chip-on-Board (COB) and Multichip Modules (MCM) is described to reflect that:

COB products are ASEAs intended as a complete electronic assembly, using unpackaged chips in whole or in part, which will perform a total electronic function. COB assemblies usually plug into a mother board. For example a PC card can be a COB assembly.

MCM products are ASEMs intended as a super-part or subassembly that will be mounted on an interconnecting structure or substrate.

Sectional Design Standard for Organic Multichip Modules (MCM-L) and MCM-L Assemblies

1.0 SCOPE

This standard establishes requirements and other considerations (thermal, electrical, electromechanical and mechanical) for the design of organic mounting structure used to interconnect chip components, which in combination form the completed functional Single Chip Module (SCM-L), MCM, or MCM-L assemblies.

1.1 Purpose The purpose of this standard is to establish design principles and recommendations that **shall** be used to produce the appropriate class of multichip module or assembly. Unique design requirements for multichip modules and multichip module assemblies intended for military electronic equipment applications will be noted as such, and **shall** be fabricated by a supplier that has been qualified by the appropriate agency unless otherwise agreed to contractually.

1.2 Documentation Hierarchy Document hierarchy shall be in accordance with generic standard IPC-2221.

1.3 Presentation Presentation shall be in accordance with the generic standard IPC-2221.

1.4 Interpretation Interpretation shall be in accordance with the generic standard IPC-2221.

1.5 Classification of Products Classification of products shall be in accordance with the generic standard IPC-2221 and as follows:

1.5.1 Assembly Types Assembly types are defined as:

Single-sided/Double-sided — Multiple bare and/or chip scale packaged die assemblies analogous to single and double sided printed board assemblies.

Cavity Structures — Multiple bare and/or chip scale packaged die assemblies in which the components are placed into cavities fabricated in the interconnecting structure.

Stacked Structure (includes 3-D memory packages) — Multiple bare and/or chip scale packaged die assemblies in which components are placed one on top of another.

Embedded Structures — Multiple bare and/or chip scale packaged die assemblies in which components are embedded within the interconnecting structure requiring lamination over bare die and subsequently interconnected.

Multi-Mounting Structure — Combination of any above assembly types.

1.5.2 Packaging Density The assembly of uncased or bare chips on substrates has become popular mostly due to the ability of such assemblies to reduce the area needed for interconnecting substrates. The ideal limit for such assembly would be to place all the chips tightly together, without any space in between. This would result in 100% of Packaging Efficiency, a ratio of silicon area to the substrate area. Naturally, 100% efficiency is not achievable, but this ratio is still useful in ranking various substrate construction of bare chip attachment methods.

Table 1-1 shows the different feature resolution capabilities, i.e., line widths and spacings, for the MCM-L mounting structure construction and their respective wiring density capability.

Table 1-1 MCM-L Wiring Capability

Typical wiring capability cm/cm^2 layer	Typical signal plane	Total wiring capability cm/cm^2
Standard 15	4S 8S	60 30
Extended 25	4S 8S	100 200
Sequential 30-50	2S 4S	60/100 120/200

Table 1-2 tabulates the total substrate area needed to place 16 chips (10 mm x 10 mm) on a MCM-L mounting structure using four typical chip wiring methods.

Table 1-2 MCM-L Area (mm^2) for 16 Chips (10 mm x 10 mm)

	Flip Chip	Wire Bond	Flip TAB	Reg TAB
MCM-L S/S	2500	6200	7000	8400
MCM-L D/S	1800	4300	4900	5900

1.5.3 Producibility Level Although multichip modules are usually high density interconnecting structures of bare chips, there are times when only a few bare chips are necessary to accomplish the goal of the multichip module designer. In these instances interconnection area relates to the amount of area of silicon die occupied on the module. Thus a general approximation has been made in the three levels as to the percentage of silicon area occupied on the interconnecting substrate.

The three MCM levels and their associated silicon area densities are:

Level A General Design Complexity—Preferred (<40% area density)

Level B Moderate Design Complexity—Standard (40 - 70% area density)

Level C High Design Complexity—Reduced (>70% area density)

1.6 Terms and Definitions The definition of terms used herein **shall** be as specified in IPC-T-50 or as listed below:

Organic Multichip Module (MCM-L) — A packaged assembly of unpackaged or minimally-packaged components mounted on an interconnecting structure or substrate which is fabricated using primarily printed board manufacturing processes and organic materials.

2.0 APPLICABLE DOCUMENTS

The following documents form a part of this standard to the extent specified herein. The revision of the document in effect at the time of solicitation **shall** take precedence.

2.1 Institute for Interconnecting and Packaging Electronic Circuits (IPC)[1]

IPC-T-50 Terms and Definitions for Interconnecting and Packaging Electronic Circuits

IPC-CC-110 Guidelines for Selecting Core Constructions for Multilayer Printed Wiring Board Applications

IPC-L-125 Specification for Plastic Substrates, Clad or Unclad, for High Speed/High Frequency Interconnections

IPC-MF-150 Metal Foil for Printed Wiring Applications

IPC-CF-152 Composite Metallic Materials Specification for Printed Wiring Boards

IPC-FC-232 Adhesive Coated Dielectric Films for Use as Cover Sheets for Flexible Printed Wiring
